

### Interaction Diagram for a Tied Square Concrete Column

Develop an interaction diagram for the concrete column shown in figure below. Determine 5 control points on the interaction diagram and compare of calculated values with exact values from the complete interaction diagram generated by spColumn software program.

#### Code

Building Code Requirements for Structural Concrete (ACI 318-14) and Commentary (ACI 318R-14)

#### Design Data

$$f'_c = 4,000 \text{ psi}$$

$$f_y = 60,000 \text{ psi}$$

#### Solution

Use the traditional approach hand calculations to establish the interaction diagram for the column section shown in above by determining the following 5 points:

Point 1: Pure compression

Point 2: Bar stress near tension face of member equal to zero, ( $f_s = 0$ )

Point 3: Bar stress near tension face of member equal to  $0.5f_y$  ( $f_s = -0.5f_y$ )

Point 4: Bar stress near tension face of member equal to  $f_y$  ( $f_s = -f_y$ )

Point 5: Pure bending

**Point 1 (Pure compression):**

$$\begin{aligned}\phi P_{n(\max)} &= 0.80\phi A_g [0.85f'_c + \rho_g (f_y - 0.85f'_c)] \\ &= 0.80 \times 0.65 \times 324 [(0.85 \times 4) + 0.0247 \times (60 - (0.85 \times 4))] \\ &= 808.3 \text{ kips}\end{aligned}$$

**Point 2 ( $f_s = 0$ ):**

**Determine the Neutral Axis Depth, c**

Given:  $\epsilon_s = 0$

Therefore, neutral axis depth, c is equal to effective depth, d and the tensile Force, T = 0

$$c = 15.56 \text{ in}$$

$$a = 0.85 \times 15.56 = 13.23 \text{ in}$$

Concrete compressive block force

$$C_c = 0.85f'_c 'ab$$

$$C_c = 0.85 \times 4 \times 13.23 \times 18 = 809.68 \text{ kips}$$

Check whether compression reinforcement has yielded:

Strain in first top layer:

$$\frac{\epsilon_{s1}'}{(c - d_1)} = \frac{0.003}{c}$$

$$\frac{\epsilon_{s1}'}{(15.56 - 2.44)} = \frac{0.003}{15.56}$$

$$\epsilon_{s1}' = 0.00253 > \epsilon_y = 0.00207 > \epsilon_t = 0.002$$

Therefore, section is compression control. Use  $\phi = 0.65$

First/top layer of compression reinforcement has yielded.

$$\text{Compressive force, } C_{s1} = A_{s1}' \times (f_y - 0.85f_c')$$

$$C_{s1} = 3 \times 1 \times (60 - 0.85 \times 4) = 169.8 \text{ kips}$$

Strain in Second layer of compression reinforcement;

$$\frac{\epsilon_{s2}'}{(c - 9)} = \frac{0.003}{c}$$

$$\frac{\epsilon_{s2}'}{(15.56 - 9)} = \frac{0.003}{15.56}$$

$$\epsilon_{s2}' = 0.00126 < \epsilon_y = 0.00207$$

Therefore, second layer of compression reinforcement has not yielded.

$$\text{Compressive force, } C_{s2} = A_{s2}' (\epsilon_{s2}' E_s - 0.85 f_c')$$

$$C_{s2} = 2 \times 1 \times (0.00126 \times 29000 - 0.85 \times 4) = 66.28 \text{ kips}$$

Strain on tension side

$$\epsilon_s = 0$$

Tensile force,  $T = 0$

$$P_n = C_c + C_{s1} + C_{s2} - T$$

$$P_n = 809.68 + 169.8 + 66.28 - 0$$

$$P_n = 1045.71 \text{ kips}$$

$$\phi P_n = 0.65 \times 1045.71 = 679.71 \text{ kips}$$

### Moment Capacity

Summing moments around the centroidal axis;

$$M_n = C_c \times \left( \frac{h}{2} - \frac{a}{2} \right) + C_{s1} \times \left( \frac{h}{2} - d_1 \right) + T \times \left( \frac{h}{2} - d_1 \right)$$

$$M_n = 809.68 \times \left( \frac{18}{2} - \frac{13.23}{2} \right) + 169.8 \times \left( \frac{18}{2} - 2.44 \right)$$

$$M_n = 3045 \text{ k-in} = 253.75 \text{ k-ft}$$

$$\phi M_n = 0.65 \times 253.75 = 164.94 \text{ k-ft}$$

**Point 3 ( $f_s = -0.5f_y$ ):**

**Determine the Neutral Axis Depth, c**

Given:  $0.5 \varepsilon_y = \varepsilon_s$

$$\varepsilon_s = 0.5 \times 0.00207 = 0.001035$$

Using similar triangle;

$$\frac{\varepsilon_s}{(d - c)} = \frac{\varepsilon_{cu}}{c}$$

$$\frac{0.001035}{(15.56 - c)} = \frac{0.003}{c}$$

$$0.001035 c = (15.56 - c) \times 0.003$$

$$0.001035 c = 0.04668 - 0.003c$$

$$c = 11.57 \text{ in}$$

$$a = 0.85 \times 11.57 = 9.834 \text{ in}$$

Concrete compressive block force

$$C_c = 0.85f'_c 'ab$$

$$C_c = 0.85 \times 4 \times 9.834 \times 18 = 601.84 \text{ kips}$$

Checking whether compression reinforcement has yielded:

Strain in first top layer:

$$\frac{\epsilon_{s1}'}{(c-d_1)} = \frac{0.003}{c}$$

$$\frac{\epsilon_{s1}'}{(11.57 - 2.44)} = \frac{0.003}{11.57}$$

$$\epsilon_{s1}' = 0.00237 > \epsilon_y = 0.00207 > \epsilon_t = 0.002$$

Therefore, section is compression control. Use  $\phi = 0.65$

First/top layer of compression reinforcement has yielded.

$$\text{Compressive force, } C_{s1} = A_{s1}'(f_y - 0.85f'_c)$$

$$C_{s1} = 3 \times 1 \times (60 - 0.85 \times 4) = 169.8 \text{ kips}$$

Strain in second layer of compression reinforcement;

$$\frac{\epsilon_{s2}'}{(c-9)} = \frac{0.003}{c}$$

$$\frac{\epsilon_{s2}'}{(11.57 - 9)} = \frac{0.003}{11.57}$$

$$\epsilon_{s2}' = 0.00067 < \epsilon_y = 0.00207$$

Therefore, second layer of compression reinforcement has not yielded.

$$\text{Compressive force, } C_{s2} = A_{s2}'(\epsilon_{s2}' E_s - 0.85 f'_c)$$

$$C_{s2} = 2 \times 1 \times (0.00067 \times 29000 - 0.85 \times 4) = 32.06 \text{ kips}$$

Strain on tension side

$$\epsilon_s = 0.001035 \quad (\text{Calculated previously})$$

$$\text{Tensile force, } T = A_s \epsilon_s E_s$$

$$T = 3 \times 1 \times 0.001035 \times 29000 = 90 \text{ kips}$$

$$P_n = C_c + C_{s1} + C_{s2} - T$$

$$P_n = 601.84 + 32.06 + 169.8 - 90$$

$$P_n = 713.7 \text{ kips}$$

$$\phi P_n = 0.65 \times 713.7 = 463.91 \text{ kips}$$

### Moment Capacity

Summing moments around the centroidal axis;

$$M_n = C_c \times \left( \frac{h}{2} - \frac{a}{2} \right) + C_{s1} \times \left( \frac{h}{2} - d_1 \right) + T \times \left( \frac{h}{2} - d_1 \right)$$

$$M_n = 601.84 \times \left( \frac{18}{2} - \frac{9.834}{2} \right) + 169.8 \times \left( \frac{18}{2} - 2.44 \right) + 90 \times \left( \frac{18}{2} - 2.44 \right)$$

$$M_n = 4161.6 \text{ k-in} = 346.75 \text{ k-ft}$$

$$\phi M_n = 0.65 \times 346.75 = 225.39 \text{ k-ft}$$

**Point 4 ( $f_s = -f_y$ ):**

**Determine the Neutral Axis Depth, c**

Given:  $\epsilon_y = \epsilon_s$  (Balanced condition)

At balanced condition, neutral axis depth is given by;

$$c_b = \frac{0.003}{0.003 + \frac{f_y}{E_s}} = \frac{0.003}{0.003 + 0.00207}$$

$$c_b = 9.21 \text{ in}$$

$$a_b = 0.85 \times 9.21 = 7.83 \text{ in}$$

Concrete compressive block force

$$C_c = 0.85f'_c ab$$

$$C_c = 0.85 \times 4 \times 7.83 \times 18 = 479.2 \text{ kips}$$

Checking whether compression reinforcement has yielded:

Strain in first top layer:

$$\frac{\epsilon_{s1}'}{c - d_1} = \frac{0.003}{c}$$

$$\frac{\epsilon_{s1}'}{9.21 - 2.44} = \frac{0.003}{9.21}$$

$$\epsilon_{s1}' = 0.00221 > \epsilon_y = 0.00207 > \epsilon_t = 0.002$$

Therefore, section is compression control. Use  $\phi = 0.65$

First/top layer of compression reinforcement has yielded.

$$\text{Compressive force, } C_{s1} = A_{s1}'(f_y - 0.85f'_c)$$

$$C_{s1} = 3 \times 1 \times (60 - 0.85 \times 4) = 169.8 \text{ kips}$$

Strain in second layer of compression reinforcement;

$$\frac{\epsilon_{s2}'}{c - 9} = \frac{0.003}{c}$$

$$\frac{\epsilon_{s2}'}{9.21 - 9} = \frac{0.003}{9.21}$$

$$\epsilon_{s2}' = 0.000068 < \epsilon_y = 0.00207$$

Therefore, second layer of compression reinforcement has not yielded.

$$\text{Compressive force, } C_{s2} = A_{s2}'(\epsilon_{s2}' E_s - 0.85 f'_c)$$

Since  $a = 7.83$  in, second layer of reinforcement does not lie within the compression block zone. Therefore, above equation changes to the following:

$$C_{s2} = A_{s2} (\epsilon_{s2} E_s)$$

$$C_{s2} = 2 \times 1 \times (0.00068 \times 29000) = 3.94 \text{ kips}$$

Strain on tension side

Since,  $\epsilon_s = \epsilon_s$  (Balanced condition)

Therefore, tensile reinforcement has yielded.

$$\text{Tensile force, } T = A_s f_y$$

$$T = 3 \times 1 \times 60 = 180 \text{ kips}$$

$$P_n = C_c + C_{s1} + C_{s2} - T$$

$$P_n = 479.2 + 169.8 + 3.94 - 180 = 472.94$$

$$\phi P_n = 0.65 \times 472.94 = 307.41 \text{ kips}$$

### **Moment Capacity**

Summing moments around the centroidal axis;

$$M_n = 479.2 \times \left( \frac{18}{2} - \frac{7.83}{2} \right) + 169.8 \times \left( \frac{18}{2} - 2.44 \right) + 180 \times \left( \frac{18}{2} - 2.44 \right)$$

$$M_n = 4731.42 \text{ k-in} = 394.29 \text{ k-ft}$$

$$\phi M_n = 0.65 \times 394.29 = 256.29 \text{ k-ft}$$

**Point 5 (Pure Bending):**

Use iterative procedure to determine  $\phi M_n$

Try  $c = 4.0$  in.

$$a = 0.85 \times 4 = 3.4 \text{ in}$$

Concrete compressive block force

$$C_c = 0.85f_c'ab$$

$$C_c = 0.85 \times 4 \times 3.4 \times 18 = 208.08 \text{ kips}$$

Strain on the tension side

Bottom layer in the tension zone

$$\epsilon_{s1} = 0.003 \times \left( \frac{d-c}{c} \right) = 0.003 \times \left( \frac{15.56-4}{4} \right) = 0.00867$$

$$\epsilon_y = 0.00207 < \epsilon_{s1} = 0.00867 > \epsilon_t = 0.005$$

Therefore, section is tension control. Use  $\phi = 0.9$

Therefore, bottom layer of tensile reinforcement has yielded.

$$T_1 = 3 \times 1 \times 60 = 180 \text{ kips}$$

Middle layer in the tension zone

$$\epsilon_{s2} = 0.003 \times \left( \frac{h/2-c}{c} \right) = 0.003 \times \left( \frac{9-4}{4} \right) = 0.00375$$

$$\epsilon_y = 0.00207 < \epsilon_{s2} = 0.00375 < \epsilon_{s1} = 0.00867$$

Therefore, middle layer of tensile reinforcement has yielded.

$$T_2 = 2 \times 1 \times 60 = 120 \text{ kips}$$

Strain on the compression side

$$\varepsilon_{s1}' = 0.003 \times \left( \frac{c - d_1}{c} \right) = 0.003 \times \left( \frac{4 - 2.44}{4} \right) = 0.0017$$

$$\varepsilon_{s1}' = 0.0017 < \varepsilon_y = 0.00207$$

Therefore, compression reinforcement has not yielded.

$$C_{s1} = A_{s1}' (\varepsilon_{s1}' E_s - 0.85 f_c')$$

$$C_{s1} = 2 \times 1 \times (0.0017 \times 29000 - 0.85 \times 4) = 91.8 \text{ kips}$$

Total tensile force,  $T = T_1 + T_2$

$$T = 180 + 120 = 300 \text{ kips}$$

Total compressive force,  $C = C_c + C_{s1}$

$$C = 208.08 + 91.8 = 299.88 \text{ kips} \approx 300 \text{ kips}$$

Since  $T \approx C$ , therefore, use  $c = 4.0$  in

$$M_n = 208.08 \times \left( \frac{18}{2} - \frac{3.4}{2} \right) + 91.8 \times \left( \frac{18}{2} - 2.44 \right) + 180 \times \left( \frac{18}{2} - 2.44 \right)$$

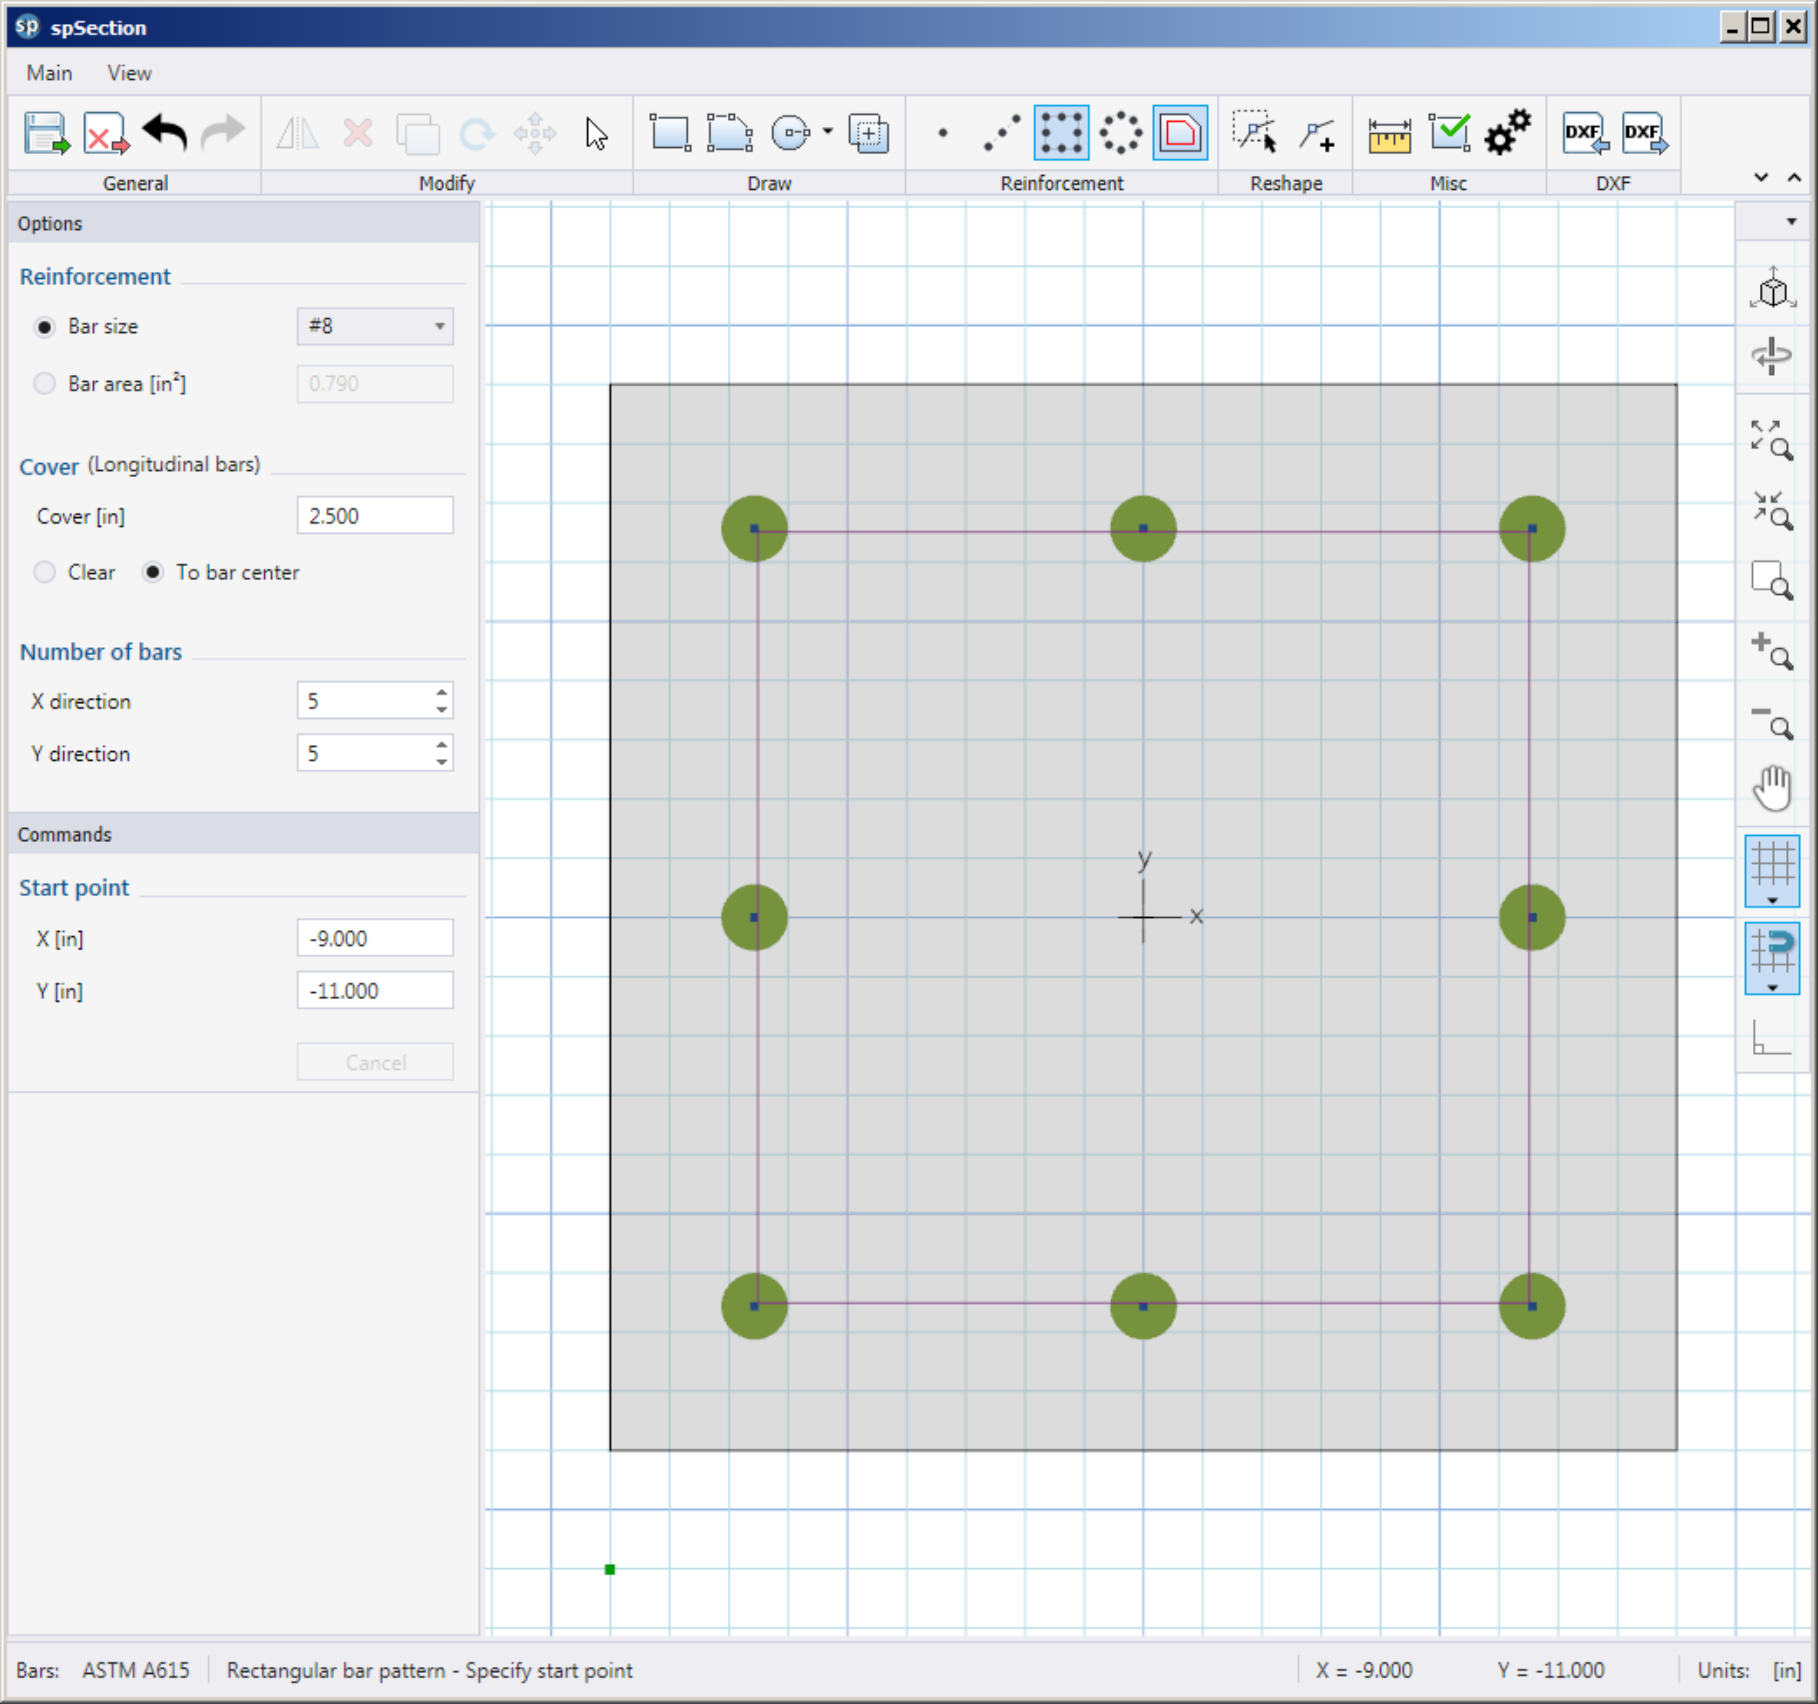

$$M_n = 3302 \text{ k-in} = 275.17 \text{ k-ft}$$

$$\phi M_n = 0.9 \times 275.17 = 247.65 \text{ k-ft}$$

### Conclusions and Observations

As summarized in Table 1 below and plotted within the spColumn interaction diagram output, the hand-calculated control point values (red line) of the interaction diagram are in very good agreement with the control point values of the interaction diagram generated by spColumn Program (black line).

<b>Table 1 – Comparison of spColumn and hand-calculated interaction diagram values</b>			
<b>Point</b>	<b>Parameter</b>	<b>Hand Calculated Values</b>	<b>spColumn Values (exact)</b>
1: Pure Compression	$\phi P_n$ (kips)	808.3	808.3
2: $f_s = 0$	$\phi P_n$ (kips)	679.71	679.8
	$\phi M_n$ (ft-kips)	164.94	164.99
3: $f_s = -0.5f_y$	$\phi P_n$ (kips)	463.91	463.8
	$\phi M_n$ (ft-kips)	225.39	225.43
4: $f_s = -f_y$	$\phi P_n$ (kips)	307.41	307.3
	$\phi M_n$ (ft-kips)	259.21	259.2
5: Pure Bending	$\phi M_n$ (ft-kips)	247.65	247.72
